DOWNLOAD: A: I cleaned up the code with a little awk, and it still looks good. I'm not certain what you're going for, so you may have to adjust the logic a bit more. `#!/usr/bin/awk -f BEGIN { # Blank out the fields for(i=1;i`

shapiro 2dQ: Crush Edge
Support System I am a newbie

to Model Railroad, but I think I am capable to help myself at least. Today I bought my first locomotive and I love it so much. The trouble is: It sits on a very tight box and there are no buffer rubber pads. It is very heavy and the trucks don't move. I would love to know a good support system for this locomotive, that is easy and cheap to buy. Something like this for instance: I would also

need the mountings. Thanks for any hints and ideas! A: There are several companies that make various kinds of rail supports. The most common ones are rubber pads. The advantage of rubber pads is that they are generally inexpensive, but the advantage of the grate support (what you link to) is that it typically handles the weight better. The downside is that it is somewhat more

expensive and typically does not come in any lighter rail than standard. Q: Can I use a PSU without the fan? I just acquired a single power supply for my desktop computer (500W). It's silent-as-hell. It works perfectly with my motherboard/chipset, but as I want to be able to plug it into other systems (think of small, silent workstations) I was wondering if I could remove

the fan and use it with the DC connectors. I know the usual rule when buying a PSU is to check if the PSU will work with the motherboard that you are going to use it with, but I don't think the fan is important for my system. Would that be possible, or will I have to buy a noisy one? A: In general, the power supply should be sized
