The present invention relates to a method for manufacturing an IC card of the type which employs a memory IC and a microcomputer IC. An IC card includes a memory IC and a microcomputer IC which are mounted in a casing, and carries out various processing such as a monetary conversion, personal identification, and financial transaction. The IC card is produced by die bonding the memory IC and the microcomputer IC to a substrate, followed by connecting a memory bus of the memory IC and a microcomputer bus of the microcomputer IC to a connector provided on the substrate. In a conventional method for manufacturing the IC card, the memory IC and the microcomputer IC are die bonded to the substrate through a thermocompression bonding method. A nickel thin layer is plated on the substrate after the bonding step, followed by attaching a connector to the nickel thin layer. In the conventional IC card manufacturing method, however, the nickel plating layer is formed on the substrate after the bonding step, so that the resultant IC card is weak against an external force and a shock. Further, when a connector is attached to the nickel plating layer, the nickel plating layer may be broken. The present invention has been made in view of the above problems, and therefore has an object of providing a method for manufacturing an IC card which can solve the above problems. In order to achieve the above object, a method for manufacturing an IC card in accordance with the present invention includes the steps of bonding a memory IC and a microcomputer IC to a substrate through a thermocompression bonding method, plating a nickel layer on the substrate after the bonding step, and attaching a connector
